## Amendments to the Specification:

Please change the Title of the Invention to read as follows:

PRINTER AND PRINT SYSTEM FOR EXECUTING A PROPER PRINT OPERATION ONLY IN A PLACE REGISTERED IN ADVANCE.

Please replace the paragraph that begins at page 50, line 3, with the following rewritten paragraph:

Fig. 24B 24 is a diagram showing a hardware structure of the print client 20 and the printer 30 when the aforementioned process is realized by hardware. A different point from the aforementioned Fig. 20B will be explained. If the public key acquisition request receiver 110 receives the public key acquisition request, then the second printer position information acquisition 122 acquires second printer position information from the position detector 54. Then, a public key generator 320 compares the first printer position information stored in the printer position information storage 310 and the second printer position information acquired by the second printer position information acquisition 122. If the first printer position information and the second printer position information coincide, then the public key generator 320 generates a public key with a passphrase containing at least the first printer position information or the second printer position information. A public key transmitter 122 transmits the public key generated by the public key generator 320 to the print client 20.
